# F-RAM Publish-Safe Evaluation Snapshot

Date: 2026-01-21

## Purpose

This document is a publish-safe summary of observed evaluation artifacts and policy posture for F-RAM. It is a frozen reference set meant for external sharing without exposing internal mechanics.

## Scope

- Evaluation artifacts (memory, shadow, and fractal reports).
- Policy summary for gated behavior.
- Redacted trace evidence (summary and sample).

## Public Description

F-RAM is a memory-focused retrieval system that emphasizes continuity and observable evaluation. This snapshot focuses on what the system has demonstrated in practice rather than internal design details.

## Policy Posture

- Fractal influence is OFF by default. Traces can be generated without affecting ranking.
- Memory capsule retrieval is supported but remains gated while tuning continues.
- Trace evidence is redacted; raw trace logs are excluded from this snapshot.

## Artifacts Included (Names Only)

- conversation_memory_eval_live_probes_20260121_075956.json
- memory_shadow_eval_live_probes_20260121_075956.json
- fractal_autoflip_live_probes_20260121_075956.json
- fractal_eval_report_live_probes_20260121_075956.md
- trace_summary_redacted.json
- trace_sample_redacted.json

## Exclusions

- Internal mechanics, algorithms, or routing heuristics.
- Private configuration values, raw observability logs, or raw trace JSONL.
- Source code, datasets, or internal prompts.

## Notes

This snapshot reports observed artifacts only. It is not a full system specification and does not claim production readiness. It is intended to support transparent discussion of evaluation results without exposing internal implementation details.
